

EXERCISE TREATMENT FOR ROTATOR CUFF INJURY

Developed by Allan M. Levy, M.D.

Rotator-Cuff-Strengthening Exercises

You can restrengthen your rotator cuff muscles initially at home with a free-weight program. Using 15 pounds as the absolute maximum

weight, do the following exercises until fatigue sets in or for 50 repetitions a day.

I. Arm Curl (standing)

Hold a dumbbell with your palm facing forward and your hand at your side. Bend your elbow and

lift the weight to your shoulder. Slowly lower the weight to the starting position.

II. Reverse Arm Curl

Hold a dumbbell with your palm facing backward and your hand at your side. Bend your elbow and lift the weight to your shoulder. Slowly lower the weight to the starting position.

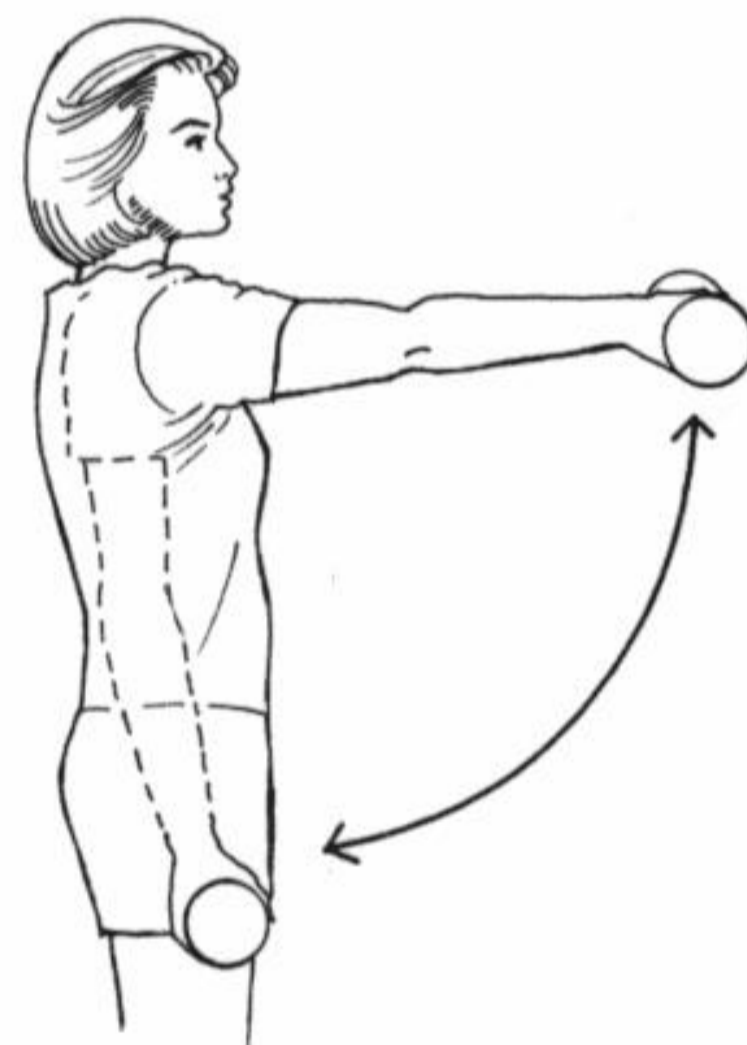

III. Front Lift (palm down)

Hold a dumbbell at your side, palm facing down with elbow locked. Lift the weight straight up, with your arm no higher than parallel to the floor. Slowly lower the weight to the starting position.

IV. Front Lift (palm up)

Hold a dumbbell at your side, palm facing up with elbow locked. Lift the weight straight up, but no more than parallel to the floor. Slowly lower the weight to the starting position.

V. Lateral Lift

Hold a dumbbell at your side, palm facing the body. Lift the weight to the side, with your arm no higher than parallel to the floor. Slowly lower the weight to the starting position.

VI. Bent-over Lateral Lift

Stand and bend over at a 90° angle. Grasp a dumbbell and, with elbow locked, lift the weight straight up to the side. Again, go no higher than parallel to the floor. Slowly lower the weight to the starting position.

VII. Bent-over Chest Lift

Stand and bend over at a 90° angle. Grasp a dumbbell and, with elbow locked, lift the weight across your chest. Slowly lower the weight to the starting position.
